

ENGINEERING DATA INTERFACE AND ELECTRICAL SPECIFICATION TRACKING  
AND ORDERING SYSTEM

ABSTRACT

5           A portable electronic engineering data interface and tracker that includes a host system  
which receives written or electronic engineering data from an engineering company for a  
construction project or subproject, transfers the information to a software program that re-  
formats the information to provide device or product level data for use in determining specific  
10 products, marking requirements, and making project management calculations, manages the  
data in a standard format and in one software package, manages revision levels and changes  
to engineering data from a field system shared among several entities, analyzes data and  
reports any changes to said data, tracks progress of the project by work completion,  
distributes information by means of the software using email for portability, sorts termination  
15 data by specific location, device, or system, and generates orders for products to be delivered.
